CCR Regulatory Requirements

USEPA CCR Rule Criteria 40 CFR 257.82	NRG Big Cajun II Power Plant Inflow Design Flood Control System Plan
<p>§257.82(a)(1) stipulates:</p> <p>(a) <i>The owner or operator of an existing or new CCR surface impoundment or any lateral expansion of a CCR surface impoundment must design, construct, operate, and maintain an inflow design flood control system as specified in paragraphs (a)(1) and (2) of this section.</i></p> <p>(1) <i>The inflow design flood control system must adequately manage flow into the CCR unit during and following the peak discharge of the inflow design flood specified in paragraph (a)(3) of this section.</i></p> <p>(2) <i>The inflow design flood control system must adequately manage flow from the CCR unit to collect and control the peak discharge resulting from the inflow design flood specified in paragraph (a)(3) of this section.</i></p>	Section 5.3.1 and 5.4.1
<p>§257.82(a)(3) stipulates:</p> <p>(3) <i>The inflow design flood is:</i></p> <p>(i) <i>For a high hazard potential CCR surface impoundment, as determined under §257.73(a)(2) or §257.74(a)(2), the probable maximum flood;</i></p> <p>(ii) <i>For a significant hazard potential CCR surface impoundment, as determined under §257.73(a)(2) or §257.74(a)(2), the 1,000-year flood;</i></p> <p>(iii) <i>For a low hazard potential CCR surface impoundment, as determined under §257.73(a)(2) or §257.74(a)(2), the 100-year flood; or</i></p> <p>(iv) <i>For an incised CCR surface impoundment, the 25-year flood.</i></p>	Section 4.0

USEPA CCR Rule Criteria 40 CFR 257.82	NRG Big Cajun II Power Plant Inflow Design Flood Control System Plan
<p>§257.82(b) stipulates:</p> <p><i>(b) Discharge from the CCR unit must be handled in accordance with the surface water requirements under §257.3-3.</i></p>	Section 3.7
<p>§257.82(c)(1) stipulates:</p> <p><i>(c) Inflow design flood control system plan— (1) Content of the plan. The owner or operator must prepare initial and periodic inflow design flood control system plans for the CCR unit according to the timeframes specified in paragraphs (c)(3) and (4) of this section. These plans must document how the inflow design flood control system has been designed and constructed to meet the requirements of this section. Each plan must be supported by appropriate engineering calculations. The owner or operator of the CCR unit has completed the inflow design flood control system plan when the plan has been placed in the facility's operating record as required by §257.105(g)(4).</i></p>	Sections 1.0 - 7.0
<p>§257.82(c)(2) stipulates:</p> <p><i>(2) Amendment of the plan. The owner or operator of the CCR unit may amend the written inflow design flood control system plan at any time provided the revised plan is placed in the facility's operating record as required by §257.105(g)(4). The owner or operator must amend the written inflow design flood control system plan whenever there is a change in conditions that would substantially affect the written plan in effect.</i></p>	Section 6.3

USEPA CCR Rule Criteria 40 CFR 257.82	NRG Big Cajun II Power Plant Inflow Design Flood Control System Plan
<p>§257.82(c)(3) stipulates:</p> <p>(3) <i>Timeframes for preparing the initial plan—</i></p> <p>(i) <i>Existing CCR surface impoundments. The owner or operator of the CCR unit must prepare the initial inflow design flood control system plan no later than October 17, 2016.</i></p> <p>(ii) <i>New CCR surface impoundments and any lateral expansion of a CCR surface impoundment. The owner or operator must prepare the initial inflow design flood control system plan no later than the date of initial receipt of CCR in the CCR unit.</i></p>	Sections 1.0 and 2.0
<p>§257.82(c)(4) stipulates:</p> <p>(4) <i>Frequency for revising the plan. The owner or operator must prepare periodic inflow design flood control system plans required by paragraph (c)(1) of this section every five years. The date of completing the initial plan is the basis for establishing the deadline to complete the first periodic plan. The owner or operator may complete any required plan prior to the required deadline provided the owner or operator places the completed plan into the facility's operating record within a reasonable amount of time. In all cases, the deadline for completing a subsequent plan is based on the date of completing the previous plan. For purposes of this paragraph (c)(4), the owner or operator has completed an inflow design flood control system plan when the plan has been placed in the facility's operating record as required by §257.105(g)(4).</i></p>	Section 6.3
<p>§257.82(c)(5) stipulates:</p> <p>(5) <i>The owner or operator must obtain a certification from a qualified professional engineer stating that the initial and periodic inflow design flood control system plans meet the requirements of this section.</i></p>	Section 7.0

USEPA CCR Rule Criteria 40 CFR 257.82	NRG Big Cajun II Power Plant Inflow Design Flood Control System Plan
<p>§257.82(d) stipulates:</p> <p><i>(d) The owner or operator of the CCR unit must comply with the recordkeeping requirements specified in §257.105(g), the notification requirements specified in §257.106(g), and the internet requirements specified in §257.107(g).</i></p>	Section 6.0

1.0 INTRODUCTION

CB&I Environmental and Infrastructure, Inc. (CB&I) has prepared the following Inflow Design Flood Control System Plan (Plan) at the request of Louisiana Generating, LLC (LaGen) (a subsidiary of NRG Energy, Inc. [NRG]) for the Fly Ash and Bottom Ash Basins located at its Big Cajun II Power Plant (BC II Plant) near New Roads, Pointe Coupee Parish, Louisiana (**Figure 1**). The BC II Plant is a coal-fired and natural gas fired power plant that has been in operation since 1980. The Fly Ash Basin and Bottom Ash Basin have been deemed to be regulated coal combustion residual (CCR) units by the U.S. Environmental Protection Agency (EPA), through the Disposal of Coal Combustion Residuals from Electric Utilities Final Rule (CCR Rule), Title 40 Code of Federal Regulations (CFR) Parts §257 and §261.

CCR regulations set forth within 40 CFR Part §257.82, provide guidelines for inflow design flood control systems to ensure that regulated CCR units are designed to safely manage stormwater flow during the inflow design flood. Specifically, §257.82(a) stipulates the following:

“The owner or operator of an existing or new CCR surface impoundment or any lateral expansion of a CCR surface impoundment must design, construct, operate, and maintain an inflow design flood control system... (1) The inflow design flood control system must adequately manage flow into the CCR unit during and following the peak discharge of the inflow design flood... and (2) The inflow design flood control system must adequately manage flow from the CCR unit to collect and control the peak discharge resulting from the inflow design flood”

There are five solid waste management units (SWMUs) at the BC II Plant that are operated as industrial surface impoundments in accordance with the Louisiana Department of Environmental Quality (LDEQ), Louisiana Solid Waste Regulations (Louisiana Administrative Code [LAC] Title 33: part VII) under Permit Number P-0108R1 for Facility Identification Number GD-077-0583. Two of the five SWMUs are required to comply with the requirements of the CCR Rule, which include the Fly Ash Basin and Bottom Ash Basin. The other three LDEQ-permitted surface impoundments at the BC II Plant that are not subject to the CCR Rule requirements include the Primary Louisiana Pollutant Discharge Elimination System (LPDES) Treatment Pond, Secondary LPDES Treatment Pond, and Rainfall Surge Pond (**Figure 2**).

This Plan is intended to provide an evaluation of the inflow design flood control system and demonstrate that the system is appropriately sized to manage the inflow design flood event. As demonstrated in this Plan, the inflow design flood control system has been designed to safely

manage the inflow design flood and is in compliance with §257.82, as described in Section 2.0. This document provides discussion of CB&I's professional judgement/opinion regarding specific aspects of the Rule as they pertain to the Fly Ash Basin and Bottom Ash Basin which have been deemed as regulated CCR units at the BC II Plant. This Plan will be placed within the Facility Operations Plan prior to October 17, 2016, in accordance with 40 CFR Part §257.82(c)(3).

2.0 REGULATORY OVERVIEW OF HYDROLOGIC & HYDRAULIC CAPACITY REQUIREMENTS

On April 17, 2015, the EPA published the CCR Rule under Subtitle D of the Resource Conservation and Recovery Act (RCRA) as 40 CFR Part §257 and §261. The purpose of the CCR Rule is to regulate the management of coal combustion residuals in regulated units for landfill and surface impoundments. Section 257.82(c) of the CCR Rule requires owners or operators of a CCR Unit to prepare an initial and periodic inflow design flood control system plans, which document how the inflow design flood control system has been designed and constructed to meet the requirements.

This Plan marks the initial analysis of the facility inflow design flood control system based on the current facility conditions. Construction activities may occur at the facility that will subsequently modify the current conditions as described within this Plan. This Plan will be amended in accordance with §257.82(2), which stipulates:

"The owner or operator of the CCR unit may amend the written inflow design flood control system plan at any time provided the revised plan is placed in the facility's operating record as required by §257.105(g)(4). The owner or operator must amend the written inflow design flood control system plan whenever there is a change in conditions that would substantially affect the written plan in effect."

This Plan will be amended to accurately analyze the inflow design flood control system associated with the current facility conditions. Amendments to this Plan will be documented within the Plan Review/Amendment Log immediately following the Table of Contents.

In addition to the above, the Plan must ensure compliance with the closure recordkeeping requirements specified in §257.105(g)(4). A written certification is provided in Section 7.0 from a qualified professional engineer in the State of Louisiana, to certify that this Plan meets the requirements of the CCR Rule.

3.0 FLY ASH BASIN AND BOTTOM ASH BASIN OVERVIEW

Pertinent site information and history related to the installation and operation of the Fly Ash and Bottom Ash Basins is presented below to provide context for the Plan.

3.1 Location, Topography, and Character

The LaGen BC II Plant is located at 10431 Cajun II Road, New Roads, Pointe Coupee Parish, Louisiana. The BC II Plant is situated in Sections 4, 5, and 37 in Township 4 South and Range 11 East. The Fly Ash Basin is located on the southwest end of the surface impoundments west of the BC II Plant and is bordered on the east by the Bottom Ash Basin; on the west by wooded property, a drainage ditch, and agricultural land; on the north by wooded property and agricultural land; and on the south by wooded property and grassy fields, as detailed on **Figures 1 and 2**. The Fly Ash Basin has an area of approximately 175 acres and the Bottom Ash Basin has an area of approximately 66 acres.

The Fly Ash Basin was constructed above natural grade with a base of approximately 30 feet Mean Sea Level (MSL) and a surrounding berm with a designed crest elevation of approximately 40-feet MSL. The Bottom Ash Basin was constructed above natural grade with a base of approximately 30 feet MSL and a surrounding berm with a designed crest elevation of approximately 48-feet MSL. The existing site topography is depicted on **Figure 3**. The Fly Ash Basin has an approximate capacity of 1,750 acre-feet with a permitted total ash storage capacity of 3,905,000 cubic yards (yd^3). The Bottom Ash Basin has an approximate capacity of 1,188 acre-feet with a permitted total ash storage capacity of 2,585,000 yd^3 . The soils underlying the Fly and Bottom Ash Basins consist of naturally occurring and/or recompacted clayey soil that is a minimum of 3-feet thick to over 10-feet thick in some areas.

3.2 Existing Regulatory Permits

The Fly Ash Basin and Bottom Ash Basin have been granted and are currently operating under a LDEQ Solid Waste Permit as an industrial surface impoundment in accordance with the Louisiana Solid Waste Regulations (LAC 33:VII) under Permit Number P-0108R1 and Facility Identification Number GD-077-0583. The Solid Waste Permit renewal was issued by the LDEQ on February 24, 2011 and allows CCR materials generated on-site at the LaGen BC II Plant to be properly disposed of within the boundaries of the Fly Ash and Bottom Ash Basins.

3.3 Fly Ash Generation, Recycling, and Disposal

Fly ash has been generated at the BC II Plant since it was constructed and became operational in 1980. Fly ash is generated from the burning of finely pulverized coal in high efficiency boilers.

The fly ash is composed primarily of oxides of silicon, aluminum, calcium, sulfur, and iron and is typically a fine, spherical particle ranging in diameter from 0.5 to 100 microns, which can be used as a soil or aggregate stabilization agent.

Fly ash that is generated at the BC II Plant has historically been recycled (sold for beneficial reuse as a cement additive, for road base, and/or for soil stabilization applications) and/or transported to the Fly Ash Basin for disposal. Recycled fly ash rates depend on the market demand and can affect the life of the Basin due to the variability in the amount of recycled material. Disposal rates therefore vary based on recycling opportunities, which vary between years. When the demand for ash exceeds production, the fly ash in the Basin can be removed and sold.

3.4 Bottom Ash Generation, Recycling, and Disposal

Bottom ash has been generated at the BC II Plant since it was constructed and became operational in 1980. Bottom ash is generated concurrently with fly ash during the combustion of coal in the boilers when particles of ash fuse together. These fused particles become too large to remain entrained in the rising flue gas and fall to the bottom of the boiler. Particles of bottom ash vary in diameter but approximate the size of coarse sand. Due to their similar origins, bottom ash and fly ash have the same approximate chemical makeup. The Bottom Ash Basin receives bottom ash from Units 1 and 3, as well as sediment from the clarifier beds associated with the cooling towers and boilers. Unit 2 is currently a gas fired unit; therefore, ash is no longer generated by this unit. The clarifier sediments are produced when water from the Mississippi River is clarified and softened for use as cooling water or boiler water. These sediments consist primarily of Mississippi River water naturally occurring silts and clays. They also contain some lime, sodium aluminate, and trace amounts of an EPA-approved water treatment polymer.

3.5 Fly Ash Basin Operations

Fly ash that is placed in the Fly Ash Basin for disposal is collected, stored in a silo, and transported by truck in dry powdered form to the Fly Ash Basin. Currently transport trucks discharge loads of fly ash in the Fly Ash Basin and dozer equipment then spread the fill evenly. The fly ash is hydrated by rainfall and compacted so that it will harden as it dries. Straight hardened fly ash has a theoretical hydraulic conductivity range of 10^{-6} centimeters per second (cm/sec) to 10^{-7} cm/sec; due to the desirable characteristics of the material, the fly ash will be a suitable material to be utilized as a subgrade material prior to placement of the cover for closure of the Basin. Periodic dozing of the fly ash material will occur as needed, within the active area to maintain a relatively uniform height.

Daily cover is not applied in the active area of fly ash disposal due to the fly ash being wetted (by rainfall) and hardened, and thereby minimizing potential dust generation. Additionally, no intermediate cover is applied to the Basin due to the rapid hardening of the fly ash. Weekly (7-day) inspections and annual reporting are undertaken for the Fly Ash Basin in line with site inspection requirements for CCR units (§257.83[b]: Inspection Requirements for CCR Surface Impoundments) to identify any stability, operational, and/or safety issues which require attention.

During the 2015 annual inspection of the Fly Ash Basin, observations indicated the water level inside the basin was approximately 5 feet below the crest of the levee and approximately two-thirds of the Fly Ash Basin was covered with open water.

3.6 Bottom Ash Basin Operations

The bottom ash from Unit 1 is collected in hoppers at the base of the boiler of Unit 1 and then transported hydraulically (sluiced) through a pipe directly to the south part of the Bottom Ash Basin. Bottom ash from Unit 3 is collected in hoppers at the base of the boiler and trucked in a hydrated state to the southwest corner of the Bottom Ash Basin for disposal. The clarifier sediments are piped to the southeast corner of the Bottom Ash Basin. The filling of the basin started along the south levee and is proceeding northward.

Periodic dozing of the bottom ash material will occur as needed, within the active area to maintain a relatively uniform height. Daily and/or interim cover is not applied in the active area of bottom ash disposal. The bottom ash is wet and/or transported in hydrated form that prevents potential dust generation. Weekly (7-day) inspections and annual reporting are undertaken for the Bottom Ash Basin in line with site inspection requirements for CCR units (§257.83[b]: Inspection Requirements for CCR Surface Impoundments) to identify any stability, operational, and/or safety issues which require attention.

During the 2015 annual inspection of the Bottom Ash Basin, observations indicated there was minimal open water in the Bottom Ash Unit and the bottom of the unit was covered with bottom ash. The north half of the pond was covered to a level of about 15 feet below the crest of the levee, while the southern half was filled to about the level of the levee. The southern half also had a large stockpile of ash at the ash disposal location. The stockpile was approximately 15 to 20 feet tall, but was no closer than approximately 50 feet from the levee. Rainfall runoff is removed from the Basin by a stormwater runoff collection system.

3.7 Existing Flood Control System

All surface runoff from the Fly Ash Basin and Bottom Ash Basin is collected and transported by gravity to the Rainfall Surge Pond. All water collected in the Rainfall Surge Pond is treated in

the Industrial Solid Waste Surface Impoundments permitted under the LPDES program (Permit No. LA0054135). The inflow design flood control system and surface water impoundment features are depicted on **Figure 2**. All item numbers cited in the following explanation refer to the equipment numbers in **Figure 2**.

Rain falling on the Fly Ash basin will fall on either the in place fly ash and then run off to the open water area of the Fly Ash Basin or on the open water. The rainfall runoff exits from the northeast corner of the basin. Item 1 on **Figure 2** is a swale and the purpose of this swale is to channel the runoff toward the Fly Ash Basin drain pipe (Item 2). Rainfall runoff leaves the Fly Ash Basin by passing through a concrete entrance box and then through a 30-inch diameter, Schedule 40 steel pipe. The Fly Ash Basin drain pipe passes through the levee that separates the Fly Ash Basin from the Bottom Ash Basin and discharges into a drainage swale (Item 3) in the Bottom Ash Basin. The “V” shaped swale in the Bottom Ash Basin runs from west to east near the north levee. This swale carries runoff from the Fly Ash Basin drain pipe (Item 2) and also collects and channels the surface runoff from the Bottom Ash Basin to the Bottom Ash Basin exit weir (Item 4). The Bottom Ash Basin exit weir serves as an inlet to the Bottom Ash Basin drain pipe (Item 5). This drain pipe is a 30-inch diameter, Schedule 40 steel pipe that carries the combined Fly Ash Basin and Bottom Ash Basin surface runoff through the north levee. The flow of water is controlled with a 30-inch butterfly valve (Item 6). Item 7 is a continuation of the 30-inch drain-pipe, which carries the runoff from the Bottom Ash Basin through a junction box (Item 8) and to the drain pipe discharge area (Item 9) in the Rainfall Surge Pond. The discharge area is fitted with a concrete apron to prevent erosion caused by the discharge of the water.

The above described equipment (Items 1 through 9) are the elements of the Fly Ash Basin and Bottom Ash Basin runoff collection system. Since the discharge point (Item 9) is the lowest point in the system, all movement of surface runoff is by gravity. The collection system was designed without pumps to minimize the operation and maintenance costs and to avoid the drainage problems that could arise from downtime due to equipment failure or maintenance.

Items 10 through 14 are components of the LPDES Treatment Ponds. Item 10 is Lift Station No. 1. Its purpose is to pump the water from the Rainfall Surge Pond up to the Primary Treatment Basin. Item 11 is the chemical storage area. Water Treatment chemicals may be added to the wastewater at this point to adjust the pH or to reduce suspended solids to the limits defined in the LPDES permit. Item 12 is the 24-inch diameter steel pipe that is used to carry the water from Lift Station No. 1 to the Primary Treatment Pond. Item 13 is an air mix chamber that is connected to the end of a 48-inch diameter steel pipe. Water flows from the Primary Treatment Pond through the pipe, over the air mix chamber and into the Secondary Treatment Pond. The

air mix chamber adds dissolved oxygen to the water flowing over it. Item 14 is Lift Station No. 2, which pumps the treated water to the Mississippi River in accordance with the LPDES permit.

4.0 HAZARD POTENTIAL DEFINITION

In accordance with §257.82(a)(3), the inflow design flood event utilized to demonstrate compliance with the Rule is determined by the hazard potential of the existing CCR surface impoundment. The hazard potential for the Fly Ash Basin and Bottom Ash Basin was presented in the CCR Rule Structural Integrity Assessment document per §257.73(a)(2). The Fly Ash and Bottom Ash Basins were determined to have a low hazard potential based on the impoundments capacity and physical location relative to downgradient inhabitants/structures and environmental systems, such that failure or mis-operation of the Fly Ash and Bottom Ash Basins was unlikely to cause loss of human life, economic loss, environmental damage, disruption of lifeline facilities, or impact other concerns. As defined in §257.82(a)(3), the 100-year flood event (100-year, 24-hour storm event) is utilized for inflow design flood control system analysis for low hazard potential surface impoundments. The inflow design control system will be evaluated to demonstrate the ability to adequately manage stormwater flow, per §257.82(a)(1), and collect and control the peak discharge, per §257.82(a)(2).

4.1 Emergency Action Plan

In accordance with §257.73(a)(3), an Emergency Action Plan (EAP) is required for all CCR units that have been classified as either a high hazard potential or significant hazard potential CCR surface impoundment. Although the Fly Ash and Bottom Ash Basins are not required to have an EAP, LaGen has prepared emergency action procedures for the BC II Plant as part of the regulatory permitting of the surface impoundments under the Louisiana Solid Waste Rules and Regulations.

5.0 INFLOW DESIGN FLOOD CONTROL SYSTEMS ANALYSIS

5.1 Methodology Overview

In order to determine compliance with 40 CFR Part §257.82 regarding the inflow design flood control system at the Fly Ash Basin and Bottom Ash Basin, existing site topography and existing inflow design flood control system features were modeled using the computer model software HydroCAD® by HydroCAD Software Solutions, LLC. This computer model was used to develop discharge rates and volumes associated with the subcatchments contributing to the flow into the Fly Ash and Bottom Ash Basins. Inflow design flood features were modeled to ensure that these features are capable of managing peak discharge rates and volumes associated with the inflow design flood.

5.2 Model Input Parameters

To ensure that the inflow design flood control system complies with 40 CFR Part §257.82, all elements were computer modeled with numerous conservative assumptions. AutoCAD was utilized to delineate key features and the computer model HydroCAD® was used to develop discharge rates and volumes for the inflow design flood event. HydroCAD® is a computer aided design program used to model hydrology and hydraulics of stormwater using either TR-20 or TR-55 procedures developed by the SCS, now the Natural Resource Conservation Service (NRCS).

The stormwater modeling methodology used the following analysis methods, as further described in subsequent text:

Runoff Calculation Method:	SCS TR-20
Pond Routing Method:	Storage Indication Method
Storm Distribution:	National Oceanographic and Atmospheric Administration (NOAA) Atlas 14, Volume 9, Version 2 – New Road, LA
Unit Hydrograph:	SCS

The NRCS developed methods TR-20 and TR-55 as standardized stormwater modeling. Both provide similar results; the main differentiation in methodology is based on the use of chart-based solutions vs. computer modeling. TR-55, frequently called the “tabular method” was developed prior to the widespread use of computer modeling. As such it was developed to utilize chart based solutions to use the SCS runoff equation. TR-20 is a computer based modeling approach that is more complex and generally considered more accurate than TR-55.

5.2.1 Rainfall Totals and Distributions

Rainfall intensities for the inflow design flood system analysis are determined by the hazard potential classification. The Fly Ash Basin and Bottom Ash Basin have been categorized as a low hazard potential CCR unit. The 100-year flood event (100-year, 24-hour storm event) will be utilized within the model, in accordance with 40 CFR Part §257.82(3) which states:

“The inflow design flood is: ... (iii) For a low hazard potential CCR surface impoundment, as determined under §257.73(a)(2) or §257.74(a)(2), the 100-year flood;”

The 24-hour, 100-year storm event rainfall depth and distribution pattern for the inflow design flood system analysis was determined for New Roads, Louisiana, using NOAA Atlas 14, Volume 9, Version 2. The rainfall depth for the modeled scenario was selected from this report and entered into HydroCAD®. TR-55 outlines that an NRCS Type III 24-hour storm distribution is appropriate within this region of Louisiana. The distribution pattern may be selected from a drop-down list in HydroCAD®. The rainfall total and distribution utilized within the analysis can be found in **Appendix A**.

5.2.2 Subcatchment Boundaries

Subcatchment areas (also known as watersheds) were delineated using AutoCAD based on topographic breaks within the areas to be analyzed. For the inflow design flood system analysis, direct precipitation onto the Fly Ash Basin and Bottom Ash Basin and all areas contributing to stormwater run-on into the Fly Ash and Bottom Ash Basins are delineated and imported into HydroCAD®. Subcatchment boundaries are depicted in **Figure 2**.

5.2.3 Run-off Coefficient Variables

The Curve Numbers method was used to identify the runoff characteristics of an area. Curve numbers consider both the land cover that will be encountered by surface water (such as grass, CCR material, standing water, etc.) as well as the type of soil that underlies the land cover. The underlying soil is important because the soil matrix has a large impact on whether water infiltrates into the soil or is shed.

The NRCS technical resource TR-55 provides lookup tables of curve numbers for combinations of various land covers and the underlying surficial soils. As further described below, CB&I developed assumptions of surficial soil types and delineated various land covers to develop a weighted average for each modeled subcatchment area using values specified in TR-55.

Surficial Soil Types

The site is covered with mostly clay and CCR material. The NRCS defines such surficial soil type as Hydrologic Soil Group D (HSG-D) based on the high run-off potential of both the native soils and CCR material. Surficial soil type within the HydroCAD® model was assumed to be HSG-D in all areas within model boundary.

Land Covers

The land covers were determined based on a review of aerial photography and the topographic survey within the model boundary.

Stormwater run-off from levee areas surrounding the Fly Ash Basin and Bottom Ash Basin boundaries were conservatively assumed to be poor grass cover. The TR-55 manual designates poor grass cover as grassland with less than 50 percent vegetative density.

Stormwater run-off from the dry operational area was assumed to be newly graded, which is congruent with hardened ash material.

Direct precipitation falling onto the wet portion of the Fly Ash and Bottom Ash Basins was assumed to be a water surface. It was assumed that the normal water level within the Fly Ash Basin and Bottom Ash Basin was at approximate elevation of 35 feet MSL.

5.2.4 Time of Concentration

The time of concentration, defined as the longest amount of time a water drop would take to travel from the headwater of a subcatchment area to its downstream edge (i.e., prior to being managed by a downstream element) was delineated in AutoCAD and manually entered in HydroCAD®.

The following assumptions were made in the calculations:

- ❑ For each subcatchment the time of concentration, T_c , is the sum of the travel times, T_t , of various consecutive flow segments. There are three types of flow: sheet flow, shallow concentrated flow, and open channel flow.
- ❑ Sheet flow is assumed to become shallow concentrated flow at 100 feet. It is noted that TR-20 and TR-55 methods specify 300 feet, but subsequent research has generally shown 100 feet to be more accurate.
- ❑ The Manning's coefficient "n" for sheet flow was assumed to be 0.011, indicative of smooth surfaces. This is appropriate for the hardened bottom ash covered subcatchment.

- The Manning's coefficient "n" for the 30-inch drainage pipes was assumed to be 0.030, indicative of a corrugated metal pipe.
- The time of concentration for the water surface area was conservatively assumed to be zero to show direct entry into the 30-inch horizontal outlet pipe.

5.2.5 Fly Ash Basin and Bottom Ash Basin Model

The Fly Ash Basin and Bottom Ash Basin were modeled by entering the area at major contour intervals between the normal water elevation and the top of perimeter berm elevation to determine incremental detention volumes. The normal water elevation was assumed to be at an approximate elevation 35 feet MSL. The top of perimeter Fly Ash Basin berm was modeled at an elevation of 38 feet MSL and the top of the perimeter Bottom Ash Basin berm as elevation of 45 feet MSL as indicated on the topographic map (**Figure 3**). The Fly Ash Basin and Bottom Ash Basins were modeled with a 30-inch horizontal pipe as the solitary outlet structure.

5.3 Model Findings

The HydroCAD® results for the 100-year flood event (100-year, 24-hour storm event) were analyzed to evaluate the inflow design flood control system at the Fly Ash Basin and Bottom Ash Basin. Results from the model indicate that the inflow design flood control system properly manages flow into and out of the Fly Ash Basin and Bottom Ash Basin. Overland flow from stormwater run-off provides appropriate flow into the Fly Ash Basin and Bottom Ash Basin. Erosion or scour is not anticipated to occur during overland flow into the Fly Ash or Bottom Ash Basins. The inflow design flood control system properly manages water from the inflow design flood event without overtopping the perimeter berm structures.

5.3.1 Inflow Design Flood Control System Analysis

The inflow design flood control system analysis was completed to demonstrate that the existing system complies with §257.82(a), which states:

“(1) The inflow design flood control system must adequately manage flow into the CCR unit during and following the peak discharge of the inflow design flood specified in paragraph (a)(3) of this section.”

“(2) The inflow design flood control system must adequately manage flow from the CCR unit to collect and control the peak discharge resulting from the inflow design flood specified in paragraph (a)(3) of this section.”

Peak discharge rates for each subcatchment were determined using HydroCAD®. A review of the peak discharge rates and flow velocities show that the Fly Ash Basin and Bottom Ash Basin have the available capacity to accept water volumes associated with the 100-year flood event. A

review of the flow velocities indicate that erosion or scour is not anticipated to occur for vegetation or CCR material covered subcatchments.

The inflow design flood control system consisting of a 30-inch horizontal pipe was modeled as the solitary outlet structure for the Fly Ash Basin and Bottom Ash Basin during the 100-year flood event. A review of the model shows that during the 100-year flood event, the Fly Ash and Bottom Ash Basins drain such that the peak elevation during the flood event is approximately 36.30 feet MSL in the Fly Ash Basin and 37.05 feet MSL in the Bottom Ash Basin. The peak elevations in the Fly Ash Basin and Bottom Ash Basin, respectively, occur approximately 25 hours and 20 hours following the start of the design rainfall. During the 100-year flood event, the inflow design flood control system provides approximately 1.70 feet of freeboard in the Fly Ash Basin and approximately 7.95 feet of freeboard in the Bottom Ash Basin between the peak water elevation and the top of the perimeter berm.

Results from the inflow design flood control system analysis can be found in **Appendix B**.

A review of the results indicate that the flood control system for the ash ponds are design limited and the ash basins act as temporary rainfall detention ponds. Due to the smaller storage capacity of the Bottom Ash Basin, it fills to a higher water stage than the Fly Ash Basin and water temporarily backflows from the Bottom Ash Basin into the Fly Ash Basin. As water discharges from the Bottom Ash Basin outlet pipe, the situation reverses and all of the storm event water is discharged from both basins. The analysis indicates that water levels return to pre-storm levels in approximately 8 to 10 days.

5.4 Engineering Evaluation of Findings

5.4.1 Design Appropriateness Based on Model Findings

Based on the model findings, it has been demonstrated that the current inflow design flood control system complies with §257.82(a) of the CCR Rule. The inflow design flood control system has been appropriately designed to properly manage direct precipitation and stormwater run-off associated with the 100-year flood event.

5.4.2 Operations and Maintenance Considerations

Until the Fly Ash Basin and Bottom Ash Basin are closed, regular inspections of the inflow design flood control system and the perimeter berm are recommended in order to clear debris, repair erosion, and monitor any erosion control measures.

6.0 RECORDS RETENTION AND MAINTENANCE

6.1 Incorporation of Plan into Operating Record

Part §257.105(g) provides record keeping requirements to ensure that the Inflow Design Flood Control System Plan must be placed in the facility's operating record. Specifically, §257.105(g) stipulates:

“(g) Operating criteria. The owner or operator of a CCR unit subject to this subpart must place the following information, as it becomes available, in the facility's operating record: (4) The initial and periodic inflow design flood control system plan as required by §257.82(c).”

This Plan will be placed within the Facility Operating Record.

6.2 Notification Requirements

Part §257.106(g) provides guidelines for the notification of the availability of the initial and periodic Plan. Specifically, §257.106(g) stipulates:

“(g) Operating criteria. The owner or operator of a CCR unit subject to this subpart must notify the State Director and/or appropriate Tribal authority when information has been placed in the operating record and on the owner or operator's publicly accessible internet site. The owner or operator must: (4) Provide notification of the availability of the initial and periodic inflow design flood control system plans specified under §257.105(g)(4)”

The State Director will be notified upon placement of this Plan in the Facility Operating Record.

Part §257.107(g) provides publicly accessible Internet site requirements to ensure that the Plan is accessible through the NRG webpage. Specifically, §257.107(g) stipulates:

“(g) Operating criteria. The owner or operator of a CCR unit subject to this subpart must place the following information on the owner or operator's CCR Web site: (4) The initial and periodic inflow design flood control system plans specified under §257.105(g)(4).”

This Plan will be uploaded to NRG CCR Compliance reporting website.

6.3 Plan Amendments

This Inflow Design Flood Control System Plan has been completed in accordance with §257.82(c)(3) to provide an initial analysis of the inflow design flood control system. LaGen is required to prepare inflow design flood control system plans every 5 years, as required by §257.82(c)(4) of the CCR Rule. The amended Plan will be reviewed and recertified by a registered professional engineer and will be placed in the facility operating record as required per §257.105(g)(4). The amended Plan will supersede and replace any prior versions. Availability of the amended Plan will be noticed to the State Director per §257.106(g)(4) and posted to the publicly accessible internet site per §257.107(g)(4).

A record of the Plan reviews/assessments is provided on the first page of this document, immediately following the Table of Contents.

7.0 PROFESSIONAL ENGINEER CERTIFICATION

The undersigned registered professional engineer is familiar with the requirements of §257.82 and has visited and examined the NRC BC II Plant or has supervised examination of the NRC BC II Plant by appropriately qualified personnel. The undersigned registered professional engineer attests that this Inflow Design Flood Control System Plan has been prepared in accordance with good engineering practice, including consideration of applicable industry standards and meets the requirements of §257.82, and that this Plan is adequate for the facility. This certification was prepared as required by §257.82(c)(5)

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

By Joseph Christopher	Date 8/20/16	Subject Surge Pond	Sheet No. 1 of 1
Checked By	Date	Project No. G312151S1	

Surge pond SF measured in CAD for Sub-task

818570 SF at CN 98 Water Surface

$$\begin{aligned} T_E &= \frac{L}{3600V} & L = 763' \quad \text{Mean depth = assumed 2'} \\ &= \frac{(gD)^{1/2}}{3600} & V = (gD)^{1/2} \\ &= \frac{((32.2)(2))^{1/2}}{3600} = 8.02 & \text{ft/sec} \\ \Rightarrow \frac{763}{(3600)(8.02)} &= 0.026 \text{ hr} \end{aligned}$$

Storage Approximated from CAD file

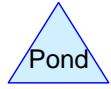

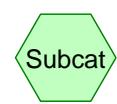

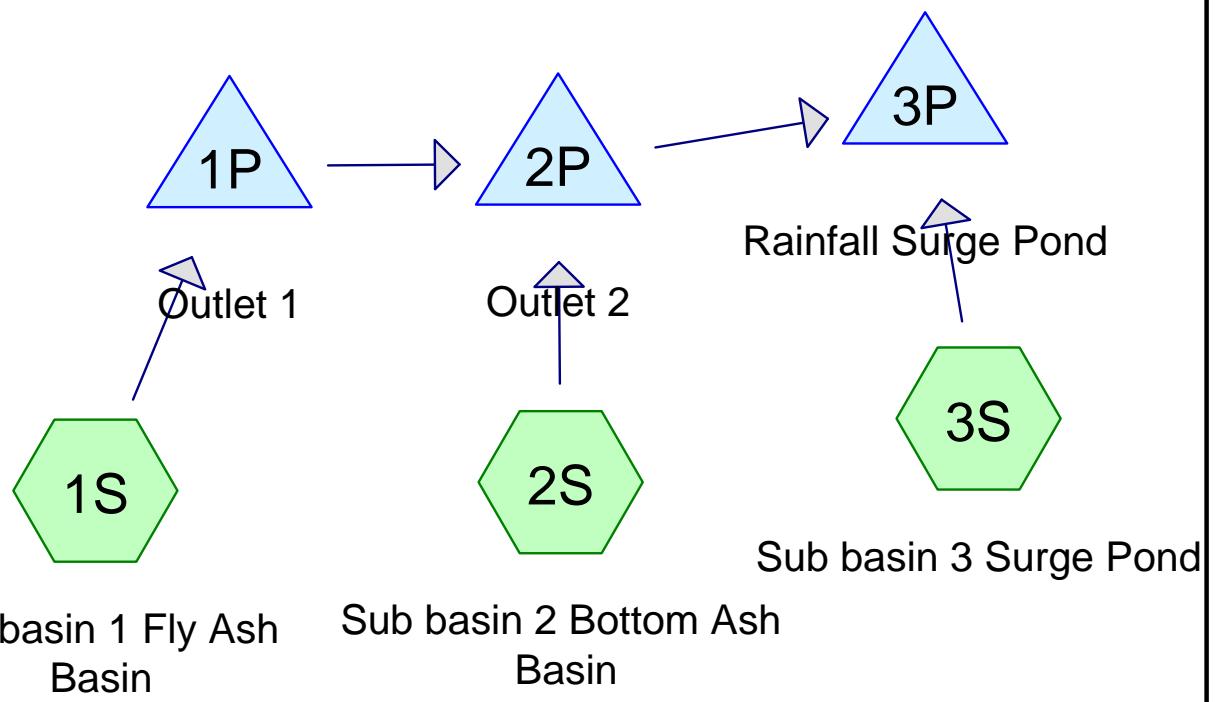

- ① EL 26.0' 4476 SF
EL 28.0' 682,493 SF
EL 30.0' 768,432 SF
EL 32.0' 818,905 SF

Waste channel outlet consider as wier flow

with wier invert @ 28' EL assumed

Crest length 43.0' measured in CAD

Crest Breadth 128.0' measurement to first bend in CAD file

Summary for Subcatchment 3S: Sub basin 3 Surge Pond

Runoff = 197.81 cfs @ 12.13 hrs, Volume= 19.510 af, Depth=12.46"

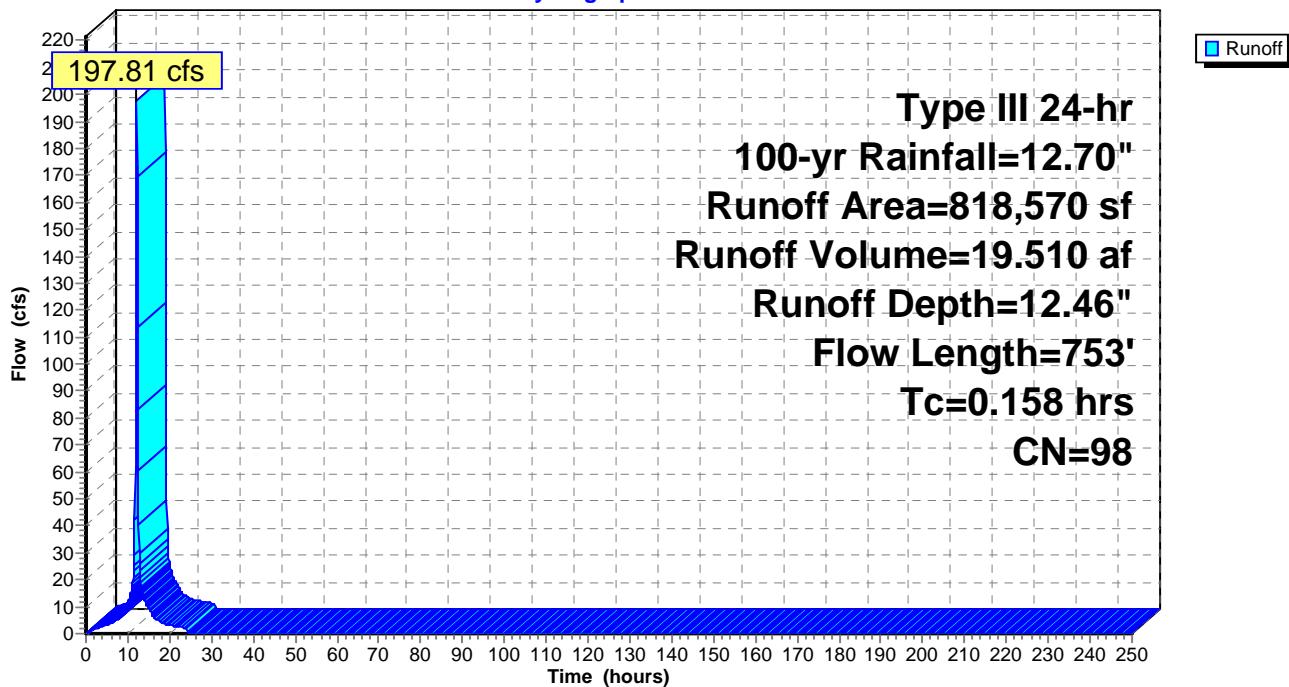

Runoff by SCS TR-20 method, UH=SCS, Weighted-CN, Time Span= 0.00-250.00 hrs, dt= 0.10 hrs
 Type III 24-hr 100-yr Rainfall=12.70"

Area (sf)	CN	Description
818,570	98	Water Surface, 0% imp, HSG D

Tc (hours)	Length (feet)	Slope (ft/ft)	Velocity (ft/sec)	Capacity (cfs)	Description
0.026	753		8.02		Lake or Reservoir, Water body Mean Depth= 2.00'
0.026	753				Total, Increased to minimum Tc = 0.158 hrs

Summary for Pond 1P: Outlet 1

Inflow Area = 0.2618 sm, Inflow Depth = 12.34" for 100-yr event

Inflow = 862.32 cfs @ 12.74 hrs, Volume= 172.239 af

Outflow = 10.74 cfs @ 119.40 hrs, Volume= 182.298 af, Atten= 99%, Lag= 6,399.5 min

Primary = 10.74 cfs @ 119.40 hrs, Volume= 182.298 af

Routing by Dyn-Stor-Ind method, Time Span= 0.00-250.00 hrs, dt= 0.10 hrs / 2

Starting Elev= 35.00' Surf.Area= 5,348,812 sf Storage= 23,269,578 cf

Peak Elev= 36.30' @ 27.40 hrs Surf.Area= 5,875,695 sf Storage= 30,584,310 cf (7,314,731 cf above start)

Plug-Flow detention time= (not calculated: initial storage exceeds outflow)

Center-of-Mass det. time= 7,894.2 min (8,682.5 - 788.3)

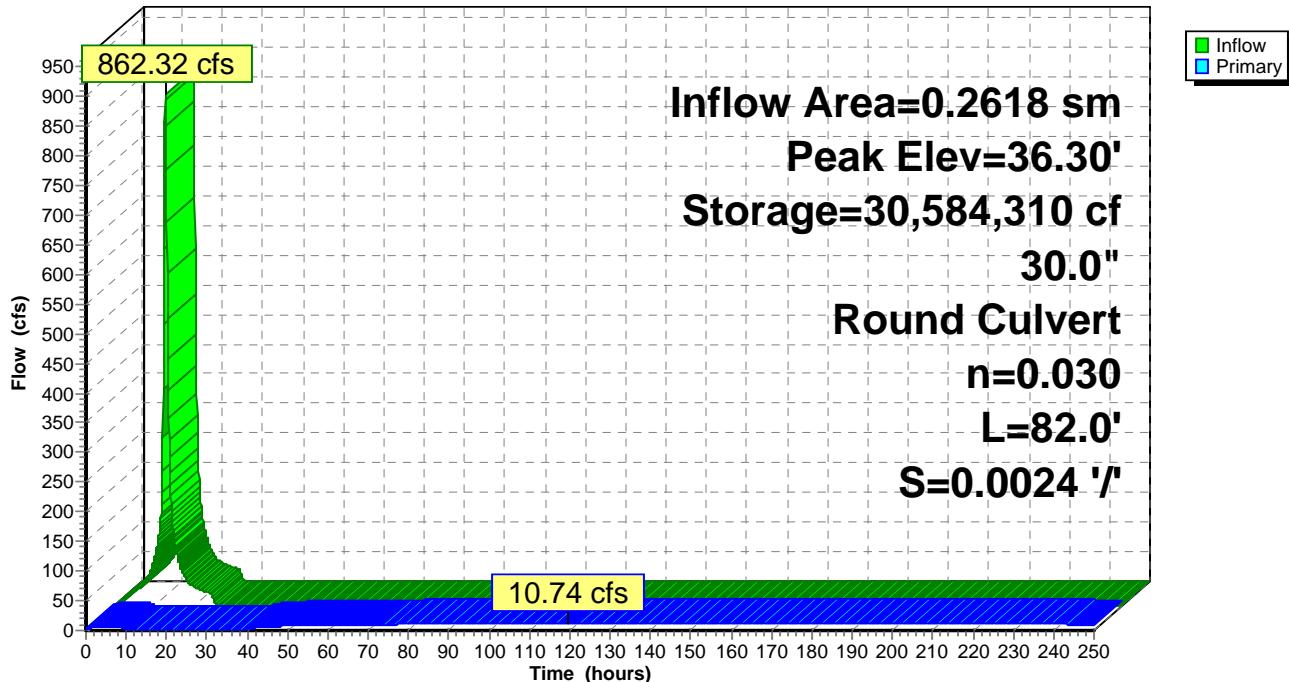

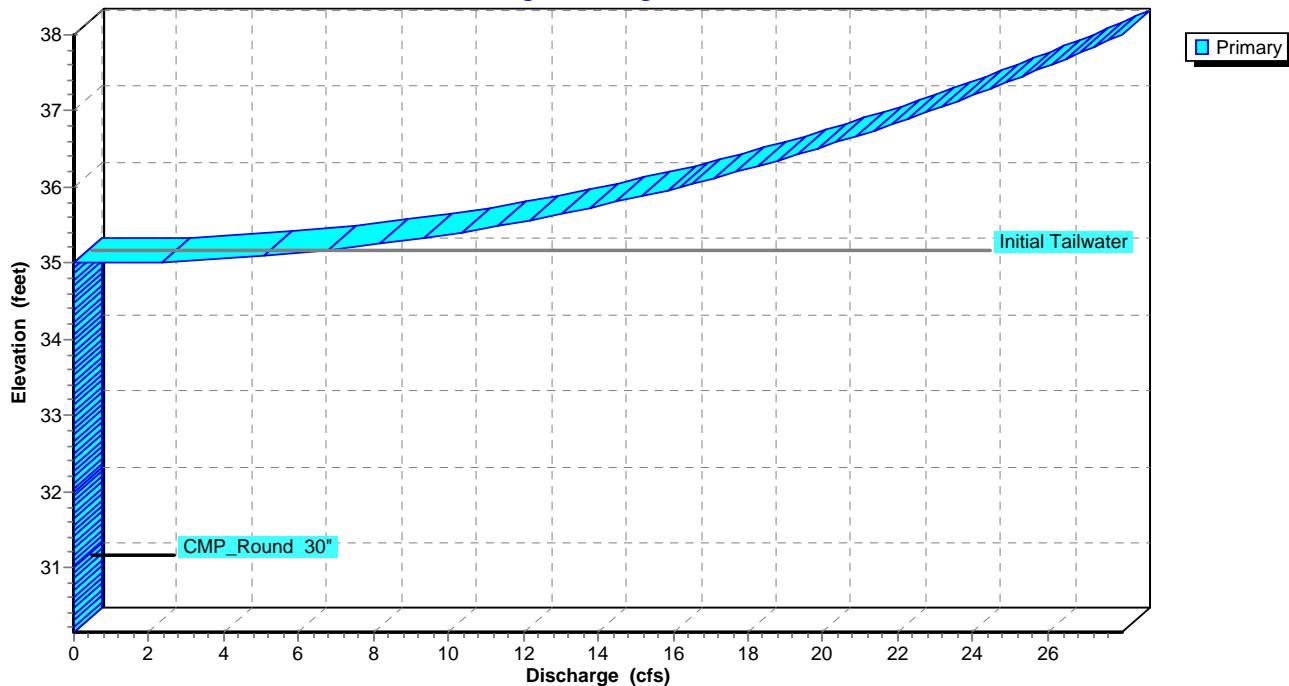

Volume	Invert	Avail.Storage	Storage Description

Summary for Pond 2P: Outlet 2

Inflow Area = 0.3591 sm, Inflow Depth > 12.69" for 100-yr event

Inflow = 458.03 cfs @ 12.35 hrs, Volume= 243.111 af

Outflow = 13.61 cfs @ 18.19 hrs, Volume= 247.605 af, Atten= 97%, Lag= 350.2 min

Primary = 13.61 cfs @ 18.19 hrs, Volume= 247.605 af

Routing by Dyn-Stor-Ind method, Time Span= 0.00-250.00 hrs, dt= 0.10 hrs / 2

Starting Elev= 35.00' Surf.Area= 516,145 sf Storage= 490,063 cf

Peak Elev= 37.05' @ 18.19 hrs Surf.Area= 1,141,496 sf Storage= 2,310,030 cf (1,819,967 cf above start)

Plug-Flow detention time= 1,146.2 min calculated for 236.354 af (97% of inflow)

Center-of-Mass det. time= 585.5 min (7,290.5 - 6,705.0)

Summary for Pond 3P: Rainfall Surge Pond

Inflow Area = 0.3885 sm, Inflow Depth > 12.89" for 100-yr event

Inflow = 210.20 cfs @ 12.13 hrs, Volume= 267.114 af

Outflow = 42.68 cfs @ 12.73 hrs, Volume= 248.190 af, Atten= 80%, Lag= 36.1 min

Primary = 42.68 cfs @ 12.73 hrs, Volume= 248.190 af

Routing by Dyn-Stor-Ind method, Time Span= 0.00-250.00 hrs, dt= 0.10 hrs / 2

Peak Elev= 28.51' @ 12.73 hrs Surf.Area= 704,545 sf Storage= 1,042,879 cf

Plug-Flow detention time= 1,089.1 min calculated for 248.142 af (93% of inflow)

Center-of-Mass det. time= 511.0 min (7,323.0 - 6,812.0)
